

Project: *The Assembly Lab*

Engine: Unity

Platform: PC

Genre: Simulation

Summary: This game was a capstone project made by students at the Northern Alberta Institute of Technology. Under the supervision of a former AAA game developer. It is a physics sandbox game with optional touch screen controls.

Game Design: I envisioned and pitched the game's main mechanics, such as tools (rockets, bombs, etc.), connecting objects, fluids, and touch controls. Then I wrote a game design document that was referenced throughout development to make sure we were on track.

UI Programming: I programmed basically all UI elements such as the main menu, pause menu, and HUD buttons. The gravity slider is the thing I am most proud of, since it has some pretty cool effects on gameplay.

Art: I created meshes and textures for 3D models of several objects such as geometric blocks, bombs, pins, and conveyor belts. I also supervised the implementation of all textures and materials into Unity.
