

Project: *MMX Engine*

Engine: Unreal Engine 5

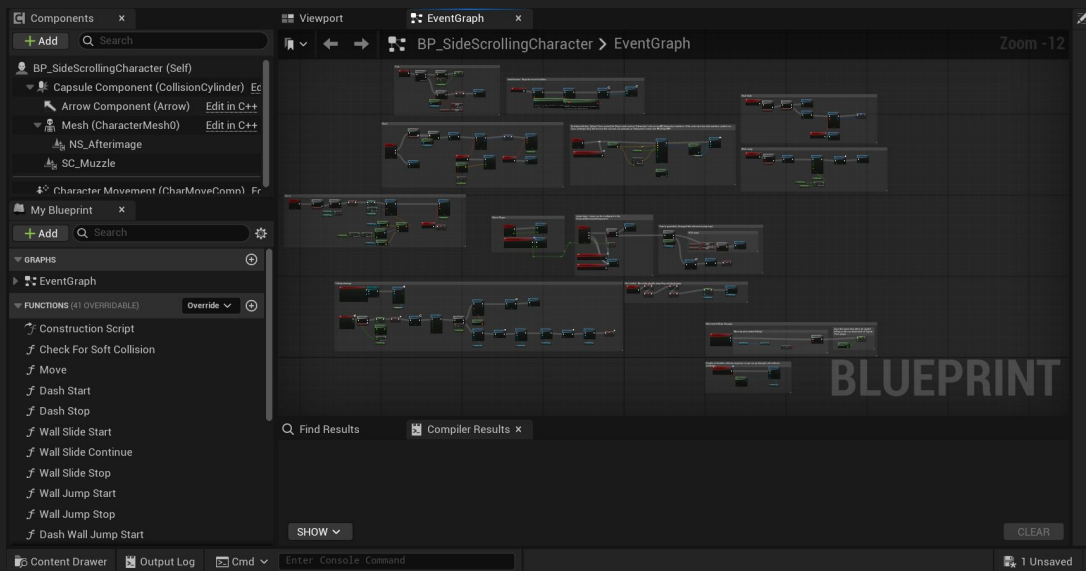

Platform: PC

Genre: Platformer

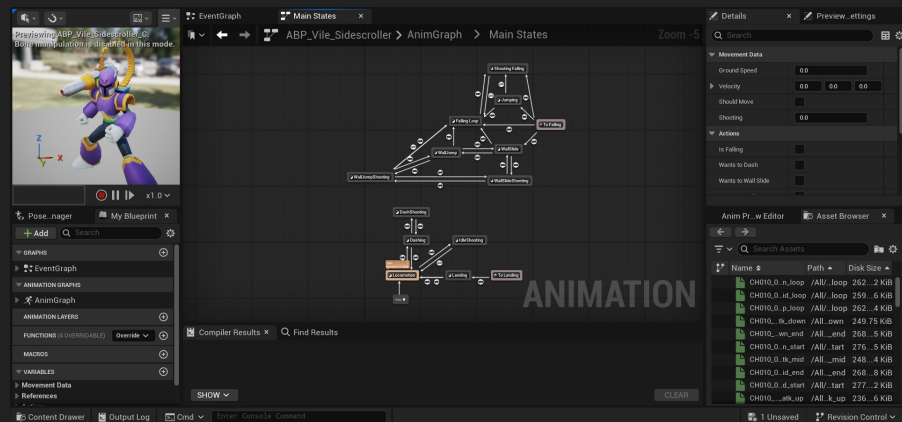

Summary: This game was a personal project, attempting to recreate the movement and combat from the *Mega Man X* series of games. The goal was to learn how to program and design in Unreal Engine.

Programming: Unreal has a built-in 2.5D platformer template which helped immensely, but adding the intricacies of Mega Man X was no small task. Using Blueprints, I implemented wall jumping, wall sliding, shooting, and dashing.

*The Blueprints for the player character's movement.*

Animation: Using assets ripped from the mobile game *Mega Man X DiVE*, I imported them into Unreal. I had to target the model to the animations and create an Animation Blueprint with a state machine and Blend Spaces to ensure all the platformer animations worked smoothly. I also used the Animation Sequencer to plan out the exact moments of each animation.

*The Blueprints for the player character's movement.*

VFX: I also learned about particle systems in Unreal and used them to create projectiles, explosions, and the after-image when the player dashes or dash-jumps. I figured out how to recreate this by spawning in a certain number of particles on the vertices of the model over time during the dash.

*The after-image effect in action.*
