

Project: Silicon Garden

Engine: Twine (SugarCube)

Platform: Browser

Genre: Interactive Fiction

Summary: This project was an attempt at exploring branching narrative and learning how to use Twine, a powerful tool for prototyping narrative moments and flow in other video games.

**Writing & Scripting:** I planned the story's branching structure in the node-based flow editor in Twine, mapping every player choice to its consequences. Dialogue options range from cooperative to hostile, and from detailed to straightforward. The chart shows how the story branches, with each conversation node leading to different paths depending on the player's responses. This let me visualize the full scope of the narrative, ensure no branch was a dead end, and keep the player-driven event flow consistent across multiple paths. Thanks to my knowledge of HTML and CSS, I was also able to customize the game's appearance to better fit the tone.

*The Twine logic for the story's advancement.*
